

# Data Representation

## Lab 06.03: using a package

Lecturer: Andrew Beatty

In this lab we are going to use the package PyGitHub to interact with github

It is easier than making all our own requests;

Install using

Pip install PyGithub

Documentation on this package:

- <https://pygithub.readthedocs.io/en/latest/introduction.html>

For examples

- <https://pygithub.readthedocs.io/en/latest/examples.html>

Full reference

- <https://pygithub.readthedocs.io/en/latest/reference.html>

the key that we are using is

```
b55d312da577ba479f7dc4f8f3f5b1384bdf3b2-e
```

Remove this  
minus sign

I put the minus sign in because as a security measure github removes access for the key if it is uploaded to github

1. install pygithub

```
pip install PyGithub
```

2. Write a python script called lab06.03.01-githubbymodule.py
3. Test that your pygithub works

```
from github import Github

# remove the minus sign from the key
g = Github("b55d312da577ba479f7dc4f8f3f5b1384bdf3b2-e")

for repo in g.get_user().get_repos():
    print(repo.name)
```

4. Modify the program to get the clone url of the repository aPrivateOne

```
g = Github("b55d312da577ba479f7dc4f8f3f5b1384bdf3b2-e")

repo = g.get_repo("datarepresentationstudent/aPrivateOne")
print(repo.clone_url)
```

5. Modify this to get the download url of the file in this repository called test.txt

```
fileInfo = repo.get_contents("test.txt")
urlOfFile = fileInfo.download_url
print (urlOfFile)
```

6. I would comment out the print statements once you are happy the program is working

7. Use the `download_url` to make a http request to the file can output the contents of the file (TEXT contents).

```
response = requests.get(urlOfFile)
contentOfFile = response.text
print (contentOfFile)
```

8. Append the text more stuff (with a newline character) to the contents of the file.

```
newContents = contentOfFile + " more stuff \n"
print (newContents)
```

9. Update the contents of the file on git up by using the function

**`update_file(path, message, content, sha, branch=NotSet, committer=NotSet, author=NotSet)`**

```
gitHubResponse=repo.update_file(fileInfo.path,"updated by prog",newContents
,fileInfo.sha)
print (gitHubResponse)
```
